

There is no substitute for quality: Ipsen fans for atmosphere furnaces.

Fans in atmosphere furnaces are exposed to heavy loading and as such are typical wear parts. Forces arise, especially during start-up, which over time reinforce the tiniest already existing imbalances. In the worst case scenario this can lead to disintegration of the fan. Not only does this endanger the charge currently being treated, it also puts the expensive furnace lining at risk.

Therefore it is important to change fan blades in a timely manner and no later than when they become noticeably noisy. Only original Ipsen fan blades should be used, which must be fitted by competent Ipsen service staff, as it is only in so doing that optimum operation is guaranteed.

Ipsen fan blades are made as a single-piece casting, precisely balanced, both statically and dynamically, and are notable for their high dimensional stability. They are X-rayed and their running properties thoroughly tested before they are released. Finally, during initial operation, our service technicians carry out one last set of vibration measurements so you can be sure that everything is running perfectly concentrically.

Ipsen fan blades are available in 18½" (470 mm), 20½" (520 mm) and 24" (610 mm) sizes and always available from stock.

The Ipsen PLUS warranty:

Ipsen warrants all wearing parts for nine months. For non-wearing parts the warranty runs for 30 months from the time of installation by an Ipsen service technician.
